

BCN CLOUD VOICE

The Benefits of Geo Redundancy

HIGH AVAILABILITY

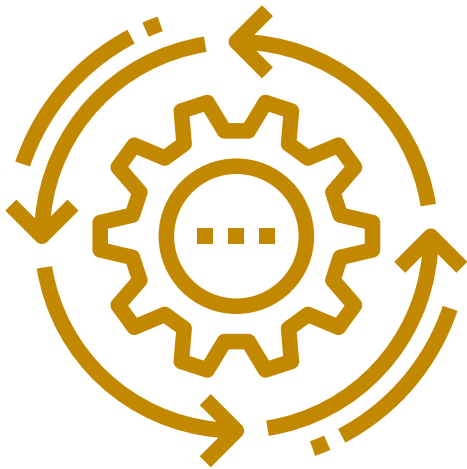

Fault tolerant system that provides day-to-day continuity under normal conditions.

- Guarantees 99.99% up time
- Ensures data integrity
- Provides fail over insurance when primary server is down
- Mitigates maximum bearable downtime during disruption
- Improves recovery time after disruption to ensure business continuity

DISASTER RECOVERY

Disaster recovery steps in when High Availability fails and allows an organization to maintain or resume mission-critical functions.

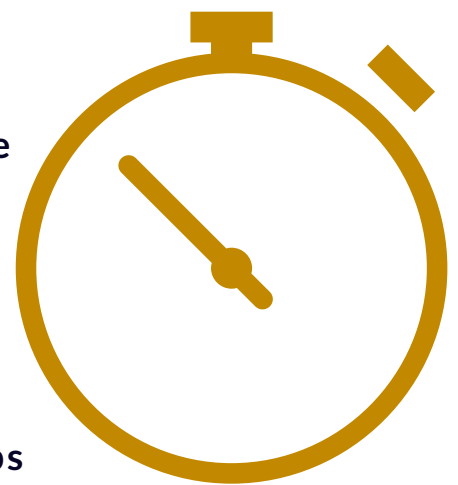

- Allows business continuity in the wake of disruption such as an office power outage
- Provides efficient re-routing of service to a functional data center
- Initiates business continuity plans, strategies and protocols already in place
- Offers a structured approach to unplanned incidents that impact IT infrastructure
- Empowers security with risk assessments that identify potential threats

USER LATENCY

Data centers located near the end user reduces the delay before a transfer of data begins following the instruction for its transfer.

- Improves data center response time for the end user
- Allows for more requests to happen concurrently
- Reduces the amount of round trips data traffic takes
- Decreases the distance between round trips from server to user
- Helps protect call quality

The new BCN Cloud Voice solution delivers geographic redundancy via a fully integrated and meshed 3-node configuration which is indispensable in meeting the critical high availability goals for IP telephony services. For businesses relying on IP-based communications, the absence of high availability can result in decreased productivity, lost revenue, customer dissatisfaction, and weakened market position.
